Radio telescopes are big!

“Just checking.”

Radio telescopes are big!

Radio interferometric telescopes

Very Large Array (VLA) in New Mexico

Next-generation of radio interferometry rapidly approaching

- Next-generation of radio interferometric telescopes will provide **orders of magnitude improvement in sensitivity**.
- Unlock broad range of science goals.

(a) Dark energy

(b) General relativity

(c) Cosmic magnetism

(d) Epoch of reionization

(e) Exoplanets

Figure: SKA science goals. [Credit: SKA Organisation]

Square Kilometre Array (SKA)

SPDO / Swinburne Astronomy Products

The SKA poses a considerable big-data challenge

Panel 1 (Top Left): The SKA will use enough optical fiber to wrap twice around the Earth! **2x**

Panel 2 (Top Middle): The SKA will be so sensitive that it will be able to detect an airport radar on a planet tens of light years away. **Tens of light years**

Panel 3 (Top Right): The SKA will generate enough raw data to fill 15 million 64GB iPods every day! **64GB x 15 MILLION DATA**

Panel 4 (Bottom Left): The dishes of the SKA will produce 10 times the global internet traffic. **10x**

Panel 5 (Bottom Middle): The aperture arrays in the SKA could produce more than 100 times the global internet traffic. **100x**

Panel 6 (Bottom Right): The SKA central computer will have the processing power of about one hundred million PCs. **SKA super computer x 100,000,000 Personal Computers**

The SKA poses a considerable big-data challenge

The dishes of the SKA will produce 10 times the global internet traffic.

The diagram features a white satellite dish on the left, connected by a white line to a white triangle containing a globe with network nodes. To the left of the globe is a white square with the text '10x'. Above the globe are several white curved lines representing radio waves. The background is a dark blue gradient with a white horizon line of the Earth.

Radio interferometric telescopes acquire "Fourier" measurements

"Fourier"
Measurements

Radio interferometric inverse problem

- Consider the **ill-posed inverse problem** of radio interferometric imaging:

$$\mathbf{y} = \Phi \mathbf{x} + \mathbf{n},$$

where \mathbf{y} are the measured visibilities, Φ is the linear measurement operator, \mathbf{x} is the underlying image and \mathbf{n} is instrumental noise.

- Measurement operator, e.g. $\Phi = \mathbf{GFA}$, may incorporate:
 - primary beam \mathbf{A} of the telescope;
 - Fourier transform \mathbf{F} ;
 - convolutional de-gridding \mathbf{G} to interpolate to continuous uv -coordinates;
 - direction-dependent effects (DDEs)...

Interferometric imaging: recover an image from noisy and incomplete Fourier measurements.

Radio interferometric inverse problem

- Consider the **ill-posed inverse problem** of radio interferometric imaging:

$$y = \Phi x + n,$$

where y are the measured visibilities, Φ is the linear measurement operator, x is the underlying image and n is instrumental noise.

- Measurement operator, e.g. $\Phi = \mathbf{GFA}$, may incorporate:
 - primary beam \mathbf{A} of the telescope;
 - Fourier transform \mathbf{F} ;

Sparse regularisation

Synthesis and analysis frameworks

- Sparse **synthesis** regularisation problem:

$$\mathbf{x}_{\text{synthesis}} = \Psi \times \arg \min_{\alpha} \left[\|\mathbf{y} - \Phi \Psi \alpha\|_2^2 + \lambda \|\alpha\|_1 \right]$$

Synthesis framework

where consider sparsifying (e.g. wavelet) representation of image: $\mathbf{x} = \Psi \alpha$.

- Typically sparsity assumption justified by analysing example signals in transformed domain.
- Different to synthesising signals.
- Suggests sparse **analysis** regularisation problem (Elad *et al.* 2007, Nam *et al.* 2012):

$$\mathbf{x}_{\text{analysis}} = \arg \min_{\mathbf{x}} \left[\|\mathbf{y} - \Phi \mathbf{x}\|_2^2 + \lambda \|\Psi^\dagger \mathbf{x}\|_1 \right]$$

Analysis framework

(For orthogonal bases the two approaches are identical but otherwise very different.)

Sparse regularisation

Synthesis and analysis frameworks

- Sparse **synthesis** regularisation problem:

Sparse regularisation

SARA algorithm

- Sparsity averaging reweighted analysis (**SARA**)
(Carrillo, McEwen & Wiaux 2012; Carrillo, McEwen, Van De Ville, Thiran & Wiaux 2013).
- **Overcomplete dictionary** composed of a concatenation of orthonormal bases:

$$\Psi = [\Psi_1, \Psi_2, \dots, \Psi_q]$$

with following bases: Dirac (*i.e.* pixel basis); Haar wavelets (promotes gradient sparsity); Daubechies wavelets two to eight \Rightarrow concatenation of 9 bases.

- Promote average sparsity by solving the **constrained** reweighted ℓ_1 **analysis** problem:

$$\min_{\mathbf{x} \in \mathbb{R}^N} \|\mathbf{W}\Psi^\dagger \mathbf{x}\|_1 \quad \text{subject to} \quad \|\mathbf{y} - \Phi \mathbf{x}\|_2 \leq \epsilon \quad \text{and} \quad \mathbf{x} \geq 0$$

Outline

- 1 Radio interferometric imaging
- 2 Proximal MCMC sampling and uncertainty quantification
- 3 MAP estimation and uncertainty quantification

MCMC sampling and uncertainty quantification

MCMC sampling the full posterior distribution

- Sample full posterior distribution $P(\mathbf{x} | \mathbf{y})$.
- MCMC methods for high-dimensional problems (like interferometric imaging):
 - Gibbs sampling (sample from conditional distributions)
 - Hamiltonian MC (HMC) sampling (exploit gradients)
 - Metropolis adjusted Langevin algorithm (MALA) sampling (exploit gradients)

Require MCMC approach to support sparsity-promoting priors, which shown to be highly effective.

MCMC sampling the full posterior distribution

- Sample full posterior distribution $P(\mathbf{x} | \mathbf{y})$.
- MCMC methods for high-dimensional problems (like interferometric imaging):
 - Gibbs sampling (sample from conditional distributions)
 - Hamiltonian MC (HMC) sampling (exploit gradients)
 - Metropolis adjusted Langevin algorithm (MALA) sampling (exploit gradients)

Require MCMC approach to support sparsity-promoting priors,
which shown to be highly effective.

Require MCMC approach to support sparsity-promoting priors, which shown to be highly effective.

MCMC sampling with gradients

Langevin dynamics

- Consider posteriors of the following form:

$$P(\mathbf{x} | \mathbf{y}) = \underbrace{\pi(\mathbf{x})}_{\text{Posterior}} \propto \exp\left(-\underbrace{g(\mathbf{x})}_{\text{Smooth}}\right)$$

- If $g(\mathbf{x})$ differentiable can adopt MALA (Langevin dynamics).
- Based on Langevin diffusion process $\mathcal{L}(t)$, with π as stationary distribution:

$$d\mathcal{L}(t) = \frac{1}{2} \nabla \log \pi(\mathcal{L}(t)) dt + dW(t), \quad \mathcal{L}(0) = l_0$$

where W is Brownian motion.

- Need gradients so cannot support sparsity-promoting priors.

MCMC sampling with gradients

Langevin dynamics

- Consider posteriors of the following form:

$$P(\mathbf{x} | \mathbf{y}) = \underbrace{\pi(\mathbf{x})}_{\text{Posterior}} \propto \exp\left(-\underbrace{g(\mathbf{x})}_{\text{Smooth}}\right)$$

- If $g(\mathbf{x})$ differentiable can adopt MALA (Langevin dynamics).
- Based on Langevin diffusion process $\mathcal{L}(t)$, with π as stationary distribution:

$$d\mathcal{L}(t) = \frac{1}{2} \nabla \log \pi(\mathcal{L}(t)) dt + dW(t), \quad \mathcal{L}(0) = l_0$$

where W is Brownian motion.

- Need gradients so cannot support sparsity-promoting priors.

MCMC sampling with gradients

Langevin dynamics

- Consider posteriors of the following form:

$$P(\mathbf{x} | \mathbf{y}) = \underbrace{\pi(\mathbf{x})}_{\text{Posterior}} \propto \exp\left(-\underbrace{g(\mathbf{x})}_{\text{Smooth}}\right)$$

- If $g(\mathbf{x})$ differentiable can adopt MALA (Langevin dynamics).
- Based on [Langevin diffusion process](#) $\mathcal{L}(t)$, with π as stationary distribution:

$$d\mathcal{L}(t) = \frac{1}{2} \nabla \log \pi(\mathcal{L}(t)) dt + d\mathcal{W}(t), \quad \mathcal{L}(0) = l_0$$

where \mathcal{W} is Brownian motion.

- Need gradients so cannot support sparsity-promoting priors.

MCMC sampling with gradients

Langevin dynamics

- Consider posteriors of the following form:

$$P(\mathbf{x} | \mathbf{y}) = \underbrace{\pi(\mathbf{x})}_{\text{Posterior}} \propto \exp(-\underbrace{g(\mathbf{x})}_{\text{Smooth}})$$

- If $g(\mathbf{x})$ differentiable can adopt MALA (Langevin dynamics).
- Based on [Langevin diffusion process](#) $\mathcal{L}(t)$, with π as stationary distribution:

$$d\mathcal{L}(t) = \frac{1}{2} \underbrace{\nabla \log \pi(\mathcal{L}(t))}_{\text{Gradient}} dt + d\mathcal{W}(t), \quad \mathcal{L}(0) = l_0$$

where \mathcal{W} is Brownian motion.

- Need gradients so **cannot support sparsity-promoting priors**.

Proximal MALA

Moreau approximation

- Moreau approximation of $f(\mathbf{x}) \propto \exp(-g(\mathbf{x}))$:

$$f_{\lambda}^{\text{MA}}(\mathbf{x}) = \sup_{\mathbf{u} \in \mathbb{R}^N} f(\mathbf{u}) \exp\left(-\frac{\|\mathbf{u} - \mathbf{x}\|^2}{2\lambda}\right)$$

- Important properties of $f_{\lambda}^{\text{MA}}(\mathbf{x})$:

- As $\lambda \rightarrow 0$, $f_{\lambda}^{\text{MA}}(\mathbf{x}) \rightarrow f(\mathbf{x})$
- $\nabla \log f_{\lambda}^{\text{MA}}(\mathbf{x}) = (\text{prox}_{g/\lambda}^{\lambda}(\mathbf{x}) - \mathbf{x})/\lambda$

Figure: Illustration of Moreau approximations [Credit: Pereyra 2016a]

Proximal MALA

Moreau approximation

- Moreau approximation of $f(\mathbf{x}) \propto \exp(-g(\mathbf{x}))$:

$$f_{\lambda}^{\text{MA}}(\mathbf{x}) = \sup_{\mathbf{u} \in \mathbb{R}^N} f(\mathbf{u}) \exp\left(-\frac{\|\mathbf{u} - \mathbf{x}\|^2}{2\lambda}\right)$$

- Important properties of $f_{\lambda}^{\text{MA}}(\mathbf{x})$:

- As $\lambda \rightarrow 0$, $f_{\lambda}^{\text{MA}}(\mathbf{x}) \rightarrow f(\mathbf{x})$
- $\nabla \log f_{\lambda}^{\text{MA}}(\mathbf{x}) = (\text{prox}_{g^{\lambda}}(\mathbf{x}) - \mathbf{x})/\lambda$

Figure: Illustration of Moreau approximations [Credit: Pereyra 2016a]

Proximal MALA

MCMC sampling

Proximal Metropolis adjusted Langevin algorithm (Px-MALA)

Pereyra (2016a)

- Consider log-convex posteriors: $P(\mathbf{x} | \mathbf{y}) = \pi(\mathbf{x}) \propto \exp(-\underbrace{g(\mathbf{x})}_{\text{Convex}})$.

- Langevin diffusion process $\mathcal{L}(t)$, with π as stationary distribution (\mathcal{W} Brownian motion):

$$d\mathcal{L}(t) = \frac{1}{2} \nabla \log \pi(\mathcal{L}(t)) dt + d\mathcal{W}(t), \quad \mathcal{L}(0) = l_0.$$

- Euler discretisation and apply Moreau approximation to π :

$$l^{(m+1)} = l^{(m)} + \frac{\delta}{2} \underbrace{\nabla \log \pi(l^{(m)})}_{\text{Moreau approximation}} + \sqrt{\delta} w^{(m)}.$$

$$\nabla \log \pi_{\lambda}(\mathbf{x}) = (\text{prox}_{g}^{\lambda}(\mathbf{x}) - \mathbf{x})/\lambda$$

- Metropolis-Hastings accept-reject step.

Proximal MALA

MCMC sampling

- Metropolis-Hastings accept-reject step.

Proximal MALA

Computing proximity operators for the analysis case

- Recall posterior: $\pi(\mathbf{x}) \propto \exp(-g(\mathbf{x}))$.

- Let $\bar{g}(\mathbf{x}) = \bar{f}_1(\mathbf{x}) + \bar{f}_2(\mathbf{x})$, where $\bar{f}_1(\mathbf{x}) = \mu \|\Psi^\dagger \mathbf{x}\|_1$ and $\bar{f}_2(\mathbf{x}) = \|\mathbf{y} - \Phi \mathbf{x}\|_2^2 / 2\sigma^2$.

Prior

Likelihood

- Must solve an optimisation problem for each iteration!

$$\text{prox}_{\bar{g}}^{\delta/2}(\mathbf{x}) = \underset{\mathbf{u} \in \mathbb{R}^N}{\text{argmin}} \left\{ \mu \|\Psi^\dagger \mathbf{u}\|_1 + \frac{\|\mathbf{y} - \Phi \mathbf{u}\|_2^2}{2\sigma^2} + \frac{\|\mathbf{u} - \mathbf{x}\|_2^2}{\delta} \right\}.$$

- Taylor expansion at point \mathbf{x} : $\|\mathbf{y} - \Phi \mathbf{u}\|_2^2 \approx \|\mathbf{y} - \Phi \mathbf{x}\|_2^2 + 2(\mathbf{u} - \mathbf{x})^\top \Phi^\dagger (\Phi \mathbf{x} - \mathbf{y})$.
- Then proximity operator approximated by

$$\text{prox}_{\bar{g}}^{\delta/2}(\mathbf{x}) \approx \text{prox}_{\bar{f}_1}^{\delta/2} \left(\mathbf{x} - \delta \Phi^\dagger (\Phi \mathbf{x} - \mathbf{y}) / 2\sigma^2 \right).$$

Single forward-backward iteration

- Analytic approximation:

$$\text{prox}_{\bar{g}}^{\delta/2}(\mathbf{x}) \approx \bar{\mathbf{v}} + \Psi \left(\text{soft}_{\mu\delta/2}(\Psi^\dagger \bar{\mathbf{v}}) - \Psi^\dagger \bar{\mathbf{v}} \right), \text{ where } \bar{\mathbf{v}} = \mathbf{x} - \delta \Phi^\dagger (\Phi \mathbf{x} - \mathbf{y}) / 2\sigma^2.$$

Proximal MALA

MYULA

MCMC sampling

Moreau-Yosida unadjusted Langevin algorithm (MYULA)

Durmus, Moulines & Pereyra (2016)

- Consider log-convex posteriors: $P(\mathbf{x} | \mathbf{y}) = \pi(\mathbf{x}) \propto \exp(-g(\mathbf{x}))$, where

$$g(\mathbf{x}) = \boxed{f_1(\mathbf{x})}^{\text{Convex}} + \boxed{f_2(\mathbf{x})}^{\text{Smooth}}.$$

- Langevin diffusion process $\mathcal{L}(t)$, with π as stationary distribution (\mathcal{W} Brownian motion):

$$d\mathcal{L}(t) = \frac{1}{2} \nabla \log \pi(\mathcal{L}(t)) dt + d\mathcal{W}(t), \quad \mathcal{L}(0) = l_0.$$

- Euler discretisation and apply **Moreau-Yosida approximation** to f_1 :

$$l^{(m+1)} = l^{(m)} + \frac{\delta}{2} \boxed{\nabla \log \pi(l^{(m)})} + \sqrt{\delta} w^{(m)}.$$

$$\nabla \log \pi(\mathbf{x}) \approx (\text{prox}_{f_1}^\lambda(\mathbf{x}) - \mathbf{x})/\lambda - \nabla f_2(\mathbf{x})$$

- No Metropolis-Hastings accept-reject step. Converges geometrically fast, where bias can be made arbitrarily small. To achieve precision target ϵ requires:
 - Worst case: order $N^5 \log^2(\epsilon^{-1}) \epsilon^{-2}$ iterations.
 - Strong convexity worst case: order $N \log(N) \log^2(\epsilon^{-1}) \epsilon^{-2}$ iterations.

Hypothesis testing

Method

- Perform **hypothesis tests** of **image structure** using Bayesian credible regions (Pereyra 2016b).
- Let C_α denote the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.

Hypothesis testing of physical structure

1. Remove structure of interest from recovered image \mathbf{x}^* .
2. Inpaint background (noise) into region, yielding surrogate image \mathbf{x}' .
3. Test whether $\mathbf{x}' \in C_\alpha$:

If $\mathbf{x}' \in C_\alpha$, then reject hypothesis that structure is as expected with confidence level $(1 - \alpha)\%$. (Equivalently, $\mathbf{x}' \notin C_\alpha$.)

If $\mathbf{x}' \notin C_\alpha$, interpret the high posterior density region as the expected region of the structure.

Hypothesis testing

Method

- Perform **hypothesis tests** of **image structure** using Bayesian credible regions (Pereyra 2016b).
- Let C_α denote the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.

Hypothesis testing of physical structure

- Remove structure of interest from recovered image \mathbf{x}^* .
- Inpaint background (noise) into region, yielding surrogate image \mathbf{x}' .
- Test whether $\mathbf{x}' \in C_\alpha$:

if $\mathbf{x}' \in C_\alpha$, then \mathbf{x}^* has similar structure to \mathbf{x} (with probability $1 - \alpha$)

if $\mathbf{x}' \notin C_\alpha$, \mathbf{x}^* is probably not high quality image (strongly dependent on choice of \mathbf{x})

Hypothesis testing

Method

- Perform **hypothesis tests** of **image structure** using Bayesian credible regions (Pereyra 2016b).
- Let C_α denote the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.

Hypothesis testing of physical structure

- 1 Remove structure of interest from recovered image \mathbf{x}^* .
- 2 Inpaint background (noise) into region, yielding surrogate image \mathbf{x}' .
- 3 Test whether $\mathbf{x}' \in C_\alpha$:
 - If $\mathbf{x}' \notin C_\alpha$ then reject hypothesis that structure is an artifact with confidence $(1 - \alpha)\%$, *i.e.* structure most likely physical.
 - If $\mathbf{x}' \in C_\alpha$ uncertainty too high to draw strong conclusions about the physical nature of the structure.

Hypothesis testing

Method

- Perform **hypothesis tests** of **image structure** using Bayesian credible regions (Pereyra 2016b).
- Let C_α denote the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.

Hypothesis testing of physical structure

- 1 Remove structure of interest from recovered image \mathbf{x}^* .

Outline

- 1 Radio interferometric imaging
- 2 Proximal MCMC sampling and uncertainty quantification
- 3 MAP estimation and uncertainty quantification**

Proximal MCMC sampling and uncertainty quantification

Approximate Bayesian credible regions for MAP estimation

- Combine **uncertainty quantification** with **fast sparse regularisation** to scale to big-data.
- Recall C_α denotes the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.
- Analytic approximation of γ_α :

$$\tilde{\gamma}_\alpha = g(\mathbf{x}^*) + N(\tau_\alpha + 1)$$

where $\tau_\alpha = \sqrt{16 \log(3/\alpha)/N}$ and $\alpha \in (4\exp(-N/3), 1)$ (Pereyra 2016b).

- Define **approximate HPD regions** by $\tilde{C}_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \tilde{\gamma}_\alpha\}$.
- **Compute \mathbf{x}^*** by sparse regularisation, then **estimate local Bayesian credible intervals** and perform **hypothesis testing** using approximate HPD regions.

Approximate Bayesian credible regions for MAP estimation

- Combine **uncertainty quantification** with **fast sparse regularisation** to scale to big-data.
- Recall C_α denotes the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.
- **Analytic approximation** of γ_α :

$$\tilde{\gamma}_\alpha = g(\mathbf{x}^*) + N(\tau_\alpha + 1)$$

where $\tau_\alpha = \sqrt{16 \log(3/\alpha)/N}$ and $\alpha \in (4\exp(-N/3), 1)$ (Pereyra 2016b).

- Define **approximate HPD regions** by $\tilde{C}_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \tilde{\gamma}_\alpha\}$.
- **Compute \mathbf{x}^*** by sparse regularisation, then **estimate local Bayesian credible intervals** and perform **hypothesis testing** using approximate HPD regions.

Approximate Bayesian credible regions for MAP estimation

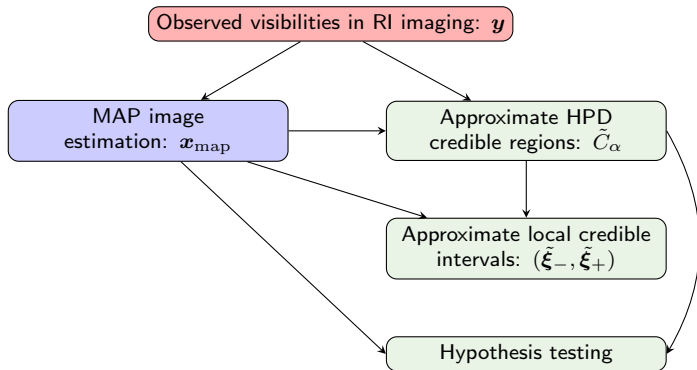

- Combine **uncertainty quantification** with **fast sparse regularisation** to scale to big-data.
- Recall C_α denotes the **highest posterior density (HPD) Bayesian credible region** with confidence level $(1 - \alpha)\%$ defined by posterior iso-contour: $C_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \gamma_\alpha\}$.
- **Analytic approximation** of γ_α :

$$\tilde{\gamma}_\alpha = g(\mathbf{x}^*) + N(\tau_\alpha + 1)$$

where $\tau_\alpha = \sqrt{16 \log(3/\alpha)/N}$ and $\alpha \in (4\exp(-N/3), 1)$ (Pereyra 2016b).

- Define **approximate HPD regions** by $\tilde{C}_\alpha = \{\mathbf{x} : g(\mathbf{x}) \leq \tilde{\gamma}_\alpha\}$.
- **Compute \mathbf{x}^*** by sparse regularisation, then **estimate local Bayesian credible intervals** and perform **hypothesis testing** using approximate HPD regions.

MAP estimation and uncertainty quantification

Local Bayesian credible intervals for MAP estimation

Local Bayesian credible intervals for sparse reconstruction

(Cai, Pereyra & McEwen 2017b)

Let Ω define the area (or pixel) over which to compute the credible interval $(\tilde{\xi}_-, \tilde{\xi}_+)$ and ζ be an index vector describing Ω (i.e. $\zeta_i = 1$ if $i \in \Omega$ and 0 otherwise).

Given $\tilde{\gamma}_\alpha$ and \mathbf{x}^* , compute the credible interval by

$$\begin{aligned} \tilde{\xi}_- &= \min_{\xi} \{ \xi \mid g_{\mathbf{y}}(\mathbf{x}') \leq \tilde{\gamma}_\alpha, \forall \xi \in [-\infty, +\infty) \}, \\ \tilde{\xi}_+ &= \max_{\xi} \{ \xi \mid g_{\mathbf{y}}(\mathbf{x}') \leq \tilde{\gamma}_\alpha, \forall \xi \in [-\infty, +\infty) \}, \end{aligned}$$

where

$$\mathbf{x}' = \mathbf{x}^*(\mathcal{I} - \zeta) + \xi\zeta .$$

Computation time

Table: CPU time in minutes for Proximal MCMC sampling and MAP estimation

Image	Method	CPU time (min)	
		Analysis	Synthesis
M31	Px-MALA	1307	944
	MYULA	618	581
	MAP	.03	.02
Cygnus A	Px-MALA	2274	1762
	MYULA	1056	942
	MAP	.07	.04
W28	Px-MALA	1122	879
	MYULA	646	598
	MAP	.06	.04
3C288	Px-MALA	1144	881
	MYULA	607	538
	MAP	.03	.02

Hypothesis testing

Comparison of numerical experiments

Table: Comparison of hypothesis tests for different methods for the analysis model.

Image	Test area	Ground truth	Method	Hypothesis test
M31	1	✓	Px-MALA	✓
			MYULA	✓
			MAP	✓
Cygnus A	1	✓	Px-MALA	✗
			MYULA*	✗
			MAP	✗
W28	1	✓	Px-MALA	✓

			MYULA	✓
			MAP	✓
	2	✗	Px-MALA	✗
			MYULA	✗
			MAP	✗

(* Can correctly detect physical structure if use median point estimator.)

Conclusions

- ① **Sparsity-promoting priors** shown to be **highly effective** and **scalable** to big-data.
 - PURIFY code provides robust framework for imaging interferometric observations (<http://basp-group.github.io/purify/>).
 - SOPT code for distributed sparse regularisation (<http://basp-group.github.io/sopt/>).

- ② **Proximal MCMC** sampling can support sparsity-promoting priors in full **Bayesian** framework:
 - Recover Bayesian credible intervals.
 - Perform hypothesis testing to test whether structure physical.

- ③ **MAP estimation** (sparse regularisation) with approximate uncertainty quantification:
 - Recover Bayesian credible intervals.
 - Perform hypothesis testing to test whether structure physical.

Scalable to big-data (computational time saving $\sim 10^5$)

Supported by:

Conclusions

- ④ **Sparsity-promoting priors** shown to be **highly effective** and **scalable** to big-data.
 - **PURIFY** code provides robust framework for imaging interferometric observations (<http://basp-group.github.io/purify/>).
 - **SOPT** code for distributed sparse regularisation (<http://basp-group.github.io/sopt/>).

Analysis vs synthesis

Analysis vs synthesis

- Typically sparsity assumption is justified by analysing example signals in terms of atoms of the dictionary.
- Different to synthesising signals from atoms.
- Suggests an **analysis-based** framework (Elad *et al.* 2007, Nam *et al.* 2012):

$$\mathbf{x}^* = \arg \min_{\mathbf{x}} \|\Omega \mathbf{x}\|_1 \text{ subject to } \|\mathbf{y} - \Phi \mathbf{x}\|_2 \leq \epsilon .$$

analysis

- Contrast with **synthesis-based** approach:

$$\mathbf{x}^* = \Psi \cdot \arg \min_{\alpha} \|\alpha\|_1 \text{ subject to } \|\mathbf{y} - \Phi \Psi \alpha\|_2 \leq \epsilon .$$

synthesis

- For **orthogonal bases** $\Omega = \Psi^\dagger$ and the two approaches are **identical**.

Analysis vs synthesis

Comparison

Figure: Analysis- and synthesis-based approaches [Credit: Nam et al. (2012)].

Analysis vs synthesis

Comparison

- Synthesis-based approach is more general, while analysis-based approach more restrictive.
- More restrictive analysis-based approach may make it more robust to noise.
- The greater descriptive power of the synthesis-based approach may provide better signal representations (too descriptive?).

Extra Slides

Bayesian interpretations

Bayesian interpretations

One Bayesian interpretation of the synthesis-based approach

- Consider the inverse problem:

$$\mathbf{y} = \Phi\Psi\boldsymbol{\alpha} + \mathbf{n}.$$

- Assume Gaussian noise, yielding the likelihood:

$$P(\mathbf{y} | \boldsymbol{\alpha}) \propto \exp\left(-\frac{\|\mathbf{y} - \Phi\Psi\boldsymbol{\alpha}\|_2^2}{2\sigma^2}\right).$$

- Consider the Laplacian prior:

$$P(\boldsymbol{\alpha}) \propto \exp\left(-\beta\|\boldsymbol{\alpha}\|_1\right).$$

- The **maximum *a-posteriori* (MAP) estimate** (with $\lambda = 2\beta\sigma^2$) is

$$\mathbf{x}_{\text{MAP-synthesis}}^* = \Psi \cdot \arg \max_{\boldsymbol{\alpha}} P(\boldsymbol{\alpha} | \mathbf{y}) = \Psi \cdot \arg \min_{\boldsymbol{\alpha}} \|\mathbf{y} - \Phi\Psi\boldsymbol{\alpha}\|_2^2 + \lambda\|\boldsymbol{\alpha}\|_1.$$

synthesis

- One** possible Bayesian interpretation!
- Signal may be ℓ_0 -sparse**, then solving ℓ_1 problem finds the correct ℓ_0 -sparse solution!

Bayesian interpretations

Other Bayesian interpretations of the synthesis-based approach

- Other Bayesian interpretations are also possible (Gribonval 2011).
- Minimum mean square error (MMSE) estimators
 - synthesis-based estimators with appropriate penalty function, *i.e.* penalised least-squares (LS)
 - MAP estimators

Bayesian interpretations

One Bayesian interpretation of the analysis-based approach

- Analysis-based MAP estimate is

$$\mathbf{x}_{\text{MAP-analysis}}^* = \Omega^\dagger \cdot \arg \min_{\gamma \in \text{column space } \Omega} \|\mathbf{y} - \Phi \Omega^\dagger \gamma\|_2^2 + \lambda \|\gamma\|_1.$$

analysis

- Different to synthesis-based approach if analysis operator Ω is not an orthogonal basis.
- Analysis-based approach **more restrictive** than synthesis-based.
- Similar ideas promoted by Maisinger, Hobson & Lasenby (2004) in a Bayesian framework for wavelet MEM (maximum entropy method).
